

## Database Model:

### Class User(models.Model):

    Address = models.CharField(max\_length=255)

    Hash = (this needs to have no max length)

```
class User(models.Model):  
    address = models.CharField(max_length=255)  
    hash = models.CharField(max_length=255)
```

## Endpoints:

**GET** - I need to be able to fetch a user by their address and return the hash

**POST** - I need to be able to add users and their hashes. Preferably by csv or list if possible

**PUT** - I need to be able to look up a users address and update their hash

## Deployment:

I need it deployed on Heroku

**That's it! No frontend needed**
